

### (a) Conditional response

Incumbent  $S$  + commitments  $C$   
+ deliberate releases  $E$

Fixed base  $B$ ; nested repair sets  $R$   
Actual known feasible warm set

Response graph  
rewards  $\cdot$  conflicts  $\cdot$  clique factors

Different release sets define different actions.

### (b) Joint recovery value

Shared structural encoder  
one paid encoding per  $(R, \text{warm})$

Request head  
native work budget + remaining time

Clique-capacity readout  
weighted fractional occupancy

Exact immediate offset  $q$  is added after  
readout.

### (c) Paid execution

Prioritize unspent requests  
[predicted gain - best gain] $_+$  / cost

Finite repair procedure  
validate membership + native objective

Retain an improving feasible schedule  
record actual validation and return time

All preparation, scoring and validation are  
paid.
